Table 1. First-stage effects on eight-year schooling completion

Specification	**Raw difference**		**Local linear RDD**	
Outcome	*No donut*	*12-month donut*	*No donut*	*12-month donut*
A Father cutoff				
Cutoff parent's completion	**0.174*** **	**0.178*** **	**0.135*** **	**0.139*** **
Robust standard error	[0.014]	[0.016]	[0.028]	[0.037]
Observations	4,117	3,560	4,117	3,560
Spouse's completion	**0.170*** **	**0.193*** **	0.005	0.016
Robust standard error	[0.016]	[0.017]	[0.030]	[0.039]
Observations	4,066	3,512	4,066	3,512
B Mother cutoff				
Cutoff parent's completion	**0.254*** **	**0.284*** **	**0.111*** **	**0.169*** **
Robust standard error	[0.014]	[0.015]	[0.028]	[0.037]
Observations	5,045	4,352	5,045	4,352
Spouse's completion	**0.127*** **	**0.141*** **	-0.018	-0.044
Robust standard error	[0.014]	[0.015]	[0.028]	[0.037]
Observations	4,621	3,992	4,621	3,992

Notes: The dependent variable equals one when the indicated adult completed at least eight years of schooling. All estimates use a symmetric 8-year bandwidth around January 1987 and FAKTOR_HANE weights. Raw differences compare observations on either side of the cutoff. Local linear RDD estimates allow separate slopes on the two sides. Donut estimates exclude birth months -12 through +11. No additional covariates are included. Robust standard errors are in brackets. Significant coefficients are bold. *** p<0.01, ** p<0.05, * p<0.10.
