| Birth month clusters no donut | 192 | 168 | 144 | 120 | 96 |

*Notes:* The outcome is one if at least one linked child is aged 9 to 13 on 12 November 2022, and zero otherwise. Ages are completed years. All retained parents enter every interval's denominator. Columns use symmetric 8- to 4-year bandwidths around January 1987. Fits are FAKTOR_HANE-weighted local linear probability RDDs with split slopes. The three specifications use no wealth control, five household-income groups, or five per-person-income groups, ranked over distinct values in all households. Donuts omit birth months -12 through +11. Bracketed standard errors are clustered by parent birth month-year. Coefficients and means are probabilities. Significant coefficients are bold. *** p<0.01, ** p<0.05, * p<0.10.
