Table 1-3 Reduced Form Effects on UNICEF Development Outcomes With Monthly Child Age Controls Using 10 October 2022 Child Age

Child age is calculated on 10 October 2022. All development respondents with complete DOB are eligible; analysis ages below 24 map to 24 and above 59 map to 59. Father RDD estimates are the primary analysis and mother RDD estimates are secondary.

Father RDD primary analysis

Notes: Cells report the OLS policy coefficient, birth-month-clustered standard error in brackets, and N. Exact child-month fixed effects for analysis months 24 to 59 are included but not displayed. Specification 2 adds female; specifications 3 and 4 separately add five household-income and five per-person-income groups; specifications 5 and 6 separately add the categorical number of aid types (0 as reference) and any aid. Neither aid control is combined with an income control. Aid specifications use only the six main questions; households with a blank or 99 on any question are excluded. Columns use symmetric 8- to 4-year bandwidths around the January 1987 cutoff. Every regression includes reform eligibility and split linear trends. Donut estimates exclude running-variable months -12 through +11 and show only the policy estimate, standard error, and N. Regressions use FAKTOR_FERT child survey weights. The sample retains one latest-born eligible child per household; all complete-DOB development respondents are included; raw ages below 24 map to 24 and above 59 map to 59. Significant policy coefficients are bold. P in the mean column is the unweighted number of positive outcomes in the no-donut 8-year sample. *** p<0.01, ** p<0.05, * p<0.10.
