Table 6 Reduced Form Effects on Activities with Children

Outcomes indicate whether any eligible adult household member did the activity with the child. Father RDD estimates are the primary analysis and mother RDD estimates are secondary.

Notes: Each cell reports the OLS policy coefficient, its birth-month-clustered standard error in brackets, and the estimation-sample N. Exact child-month fixed effects for analysis months 24 to 59 are included but not displayed. Specification 2 adds a female indicator. Columns report bandwidths of 8 to 4 years on each side of the January 1987 cutoff. Every regression includes reform eligibility and split linear trends. Donut estimates exclude running-variable months -12 through +11 and report only the policy estimate, standard error, and N. Regressions use FAKTOR_FERT child survey weights. The primary sample retains one latest-born eligible child per household, and raw child ages 60 to 62 months are assigned to analysis month 59. Significant policy coefficients are bolded. P in the mean column is the unweighted number of positive outcomes in the no-donut 8-year sample. *** p<0.01, ** p<0.05, * p<0.10.
