Table 7 Reduced Form Effects on Parent Specific Activities

Indicators are unconditional: no activity or an activity with another person is coded zero. Father RDD estimates are the primary analysis and mother RDD estimates are secondary.

Father RDD primary analysis

Notes: Each cell reports the OLS policy coefficient, its birth-month-clustered standard error in brackets, and the estimation-sample N. Exact child-month fixed effects for analysis months 24 to 59 are included but not displayed. Specification 2 adds a female indicator. Columns report bandwidths of 8 to 4 years on each side of the January 1987 cutoff. Every regression includes reform eligibility and split linear trends. Donut estimates exclude running-variable months -12 through +11 and report only the policy estimate, standard error, and N. Regressions use FAKTOR_FERT child survey weights. The primary sample retains one latest-born eligible child per household, and raw child ages 60 to 62 months are assigned to analysis month 59. Significant policy coefficients are bolded. P in the mean column is the unweighted number of positive outcomes in the no-donut 8-year sample. *** p<0.01, ** p<0.05, * p<0.10.
